## Learning Goals

- Streaming Algorithms
- Idea of AMS
- *k*-wise Independence

• Sometimes a device with limited storage processes a huge amount of data and must return statistics

- Sometimes a device with limited storage processes a huge amount of data and must return statistics
  - A network switch has a limited memory, and network traffic "streams" through it
  - At the end of the day, we may be interested in statistics such as
    - How many different requests have there been?
    - What is the most frequent request?
    - Variance of the package sizes?

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

- Sometimes a device with limited storage processes a huge amount of data and must return statistics
  - A network switch has a limited memory, and network traffic "streams" through it
  - At the end of the day, we may be interested in statistics such as
    - How many different requests have there been?
    - What is the most frequent request?
    - Variance of the package sizes?
- Input: a sequence of indices  $i_1, \ldots, i_n \in \{1, \cdots, d\}$

- Sometimes a device with limited storage processes a huge amount of data and must return statistics

- In general, if  $G_1, \dots, G_d$  are independent random variables, then  $\operatorname{Var}[\sum_i G_i x_i] = \sum_i x_i^2 \operatorname{Var}[G_i].$

<ロ> (四) (四) (三) (三) (三)

### **Proof of Claim**

#### Claim

If  $G_1, \dots, G_d$  are independent random variables, then  $\operatorname{Var}[\sum_i G_i x_i] = \sum_i x_i^2 \operatorname{Var}[G_i].$ 

## **Proof of Claim**

#### Claim

If  $G_1, \dots, G_d$  are independent random variables, then  $\operatorname{Var}[\sum_i G_i x_i] = \sum_i x_i^2 \operatorname{Var}[G_i].$ 

#### Proof.

$$\operatorname{Var}\left[\sum_{i} G_{i}x_{i}\right] = \mathbf{E}\left[\left(\sum_{i} G_{i}x_{i} - \mathbf{E}\left[\sum_{i} G_{i}x_{i}\right]\right)^{2}\right]$$
$$= \sum_{i} \mathbf{E}\left[\left(G_{i}x_{i} - \mathbf{E}\left[G_{i}x_{i}\right]\right)^{2}\right] + \sum_{i \neq j} \mathbf{E}\left[\left(G_{i}x_{i} - \mathbf{E}\left[G_{i}x_{i}\right]\right) \cdot \left(G_{j}x_{j} - \mathbf{E}\left[G_{j}x_{j}\right]\right)\right]$$
$$= \sum_{i} x_{i}^{2} \operatorname{Var}\left[G_{i}\right] + \sum_{i \neq j} \mathbf{E}\left[G_{i}x_{i} - \mathbf{E}\left[G_{i}x_{i}\right]\right] \cdot \mathbf{E}\left[G_{j}x_{j} - \mathbf{E}\left[G_{j}x_{j}\right]\right]$$
$$= \sum_{i} x_{i}^{2} \operatorname{Var}\left[G_{i}\right].$$

### Pairwise Independence

The only place where we used independence was for  $i \neq j$ ,  $\mathbf{E}[G_iG_j] = \mathbf{E}[G_i]\mathbf{E}[G_j]$ . But this is much weaker than requiring *mutual independence* for all  $G_1, \dots, G_n$ .

### Pairwise Independence

The only place where we used independence was for  $i \neq j$ ,  $\mathbf{E}[G_iG_j] = \mathbf{E}[G_i]\mathbf{E}[G_j]$ . But this is much weaker than requiring *mutual independence* for all  $G_1, \dots, G_n$ .

#### Definition

Random variables  $X_1, \dots, X_n$  are said to be *pairwise independent* if for any  $i \neq j$ ,  $X_i$  and  $X_j$  are independent, i.e., for any a, b,  $\Pr[X_i = a \land X_j = b] = \Pr[X_i = a] \cdot \Pr[x_j = b].$ 

< ロ > < 四 > < 回 > < 回 > < 回 > <

## Pairwise Independence

#### Let our sample space be $\{1, 2, 3, 4\}$ , each outcome having probability $\frac{1}{4}$ .

Let our sample space be  $\{1, 2, 3, 4\}$ , each outcome having probability  $\frac{1}{4}$ . Let  $Y_1$  take values 0, 0, 1, 1 for the four outcomes, respectively.

Let our sample space be  $\{1, 2, 3, 4\}$ , each outcome having probability  $\frac{1}{4}$ . Let  $Y_1$  take values 0, 0, 1, 1 for the four outcomes, respectively. Let  $Y_2$  take values 0, 1, 1, 0 for the four outcomes, respectively.

Let our sample space be  $\{1, 2, 3, 4\}$ , each outcome having probability  $\frac{1}{4}$ . Let  $Y_1$  take values 0, 0, 1, 1 for the four outcomes, respectively. Let  $Y_2$  take values 0, 1, 1, 0 for the four outcomes, respectively. Let  $Y_3$  take values 0, 1, 0, 1 for the four outcomes, respectively.

Let our sample space be  $\{1, 2, 3, 4\}$ , each outcome having probability  $\frac{1}{4}$ . Let  $Y_1$  take values 0, 0, 1, 1 for the four outcomes, respectively. Let  $Y_2$  take values 0, 1, 1, 0 for the four outcomes, respectively. Let  $Y_3$  take values 0, 1, 0, 1 for the four outcomes, respectively. Then  $Y_1$ ,  $Y_2$ ,  $Y_3$  are pairwise independent but not mutually independent.

### Construction of Pairwise Independent Hashing

• Recall our construction of universal hashing:

- for a prime number q, let  $\mathbb{F}_q$  denote the equivalent classes of  $0, \ldots, q-1$  mod q. All operations below are understood to be mod q.
- Let U be  $\mathbb{F}_q^m$ . For any  $\vec{s} = (s_1, \ldots, s_m) \in \mathbb{F}_q^m$ , define hash function

$$h_{\vec{s}}: u = (u_1, \ldots, u_m) \mapsto \sum_i s_i u_i.$$

### Construction of Pairwise Independent Hashing

• Recall our construction of universal hashing:

- for a prime number q, let 𝔽<sub>q</sub> denote the equivalent classes of 0, ..., q − 1 mod q. All operations below are understood to be mod q.
- Let U be  $\mathbb{F}_q^m$ . For any  $\vec{s} = (s_1, \ldots, s_m) \in \mathbb{F}_q^m$ , define hash function

$$h_{\vec{s}}: u = (u_1, \ldots, u_m) \mapsto \sum_i s_i u_i.$$

• We can see this as a random number generator:  $\vec{s}$  is the seed, drawn uniformly at random from  $\mathbb{F}_q^k$ ; u is arbitrary and fixed in  $\mathbb{F}_q^k$ .

## Construction of Pairwise Independent Hashing

# Construction of *k*-wise independent random variables

For prime q, let U be  $\mathbb{F}_q$ . Let random seeds  $s_1, \ldots, s_k$  be independent uniform samples from  $\mathbb{F}_q$ . Define

$$h_{(s_1,\ldots,s_k)}(u) \coloneqq s_1 u^{k-1} + s_2 u^{k_2} + \ldots + s_{k-1} u + s_k.$$

#### Theorem

The set of  $h_{\vec{s}}$  thus defined is a k-universal hash family.

#### Proof.

For any distinct  $u_1, \ldots, u_k \in \mathbb{F}_q$ , and  $b_1, \ldots, b_k \in \mathbb{F}_q$  that are not necessarily distinct, we show that there is a unique  $\vec{s} = (s_1, \ldots, s_k)$  such that  $h_{\vec{s}}(u_i) = b_i$  for  $i = 1, \cdots, k$ .

イロト イポト イヨト イヨト

# Proof of *k*-Universality (Cont.)

### (Continued).

The full r

$$\begin{cases} s_{1}u_{1}^{k-1} + \dots + s_{k-1}u_{1} + s_{K} = b_{1} \\ s_{1}u_{2}^{k-1} + \dots + s_{k-1}u_{2} + s_{K} = b_{2} \\ \dots \\ s_{1}u_{k}^{k-1} + \dots + s_{k-1}u_{k} + s_{k} = b_{k} \end{cases}$$

$$\Leftrightarrow \begin{pmatrix} u_{1}^{k-1} & u_{1}^{k-2} & \dots & u_{1} & 1 \\ u_{2}^{k-1} & u_{2}^{k-2} & \dots & u_{2} & 1 \\ \dots & \dots & \dots \\ u_{k}^{k-1} & u_{k}^{k-2} & \dots & u_{k} & 1 \end{pmatrix} \cdot \begin{pmatrix} s_{1} \\ s_{2} \\ \dots \\ s_{k} \end{pmatrix} = \begin{pmatrix} b_{1} \\ b_{2} \\ \dots \\ b_{k} \end{pmatrix}.$$
coefficient matrix is a Vandermonde matrix. For distinct  $u_{1}, \dots, u_{k}$  it has rank. So the system has a unique solution.

- Example: On  $\mathbb{F}_2$ , the polynomial  $x^2 + x + 1$  is irreducible.
- $(1,1) \cdot (1,0) = (0,1)$  because  $(x+1)x = x^2 + x \equiv 1 \mod (x^2 + x + 1)$ .
- Alternatively, you may think of *extending* the field  $\mathbb{F}_2$  with an additional element  $\alpha$  satisfying  $\alpha^2 = \alpha + 1$ .

イロト イポト イヨト イヨト 一日

- Answer: we see a vector in F<sup>m</sup><sub>q</sub> as coefficients of a polynomial of degree m − 1, and do multiplication of vectors as polynomial multiplications modulo a degree n *irreducible polynomial*.
- Example: On  $\mathbb{F}_2$ , the polynomial  $x^2 + x + 1$  is irreducible.
- $(1,1) \cdot (1,0) = (0,1)$  because  $(x+1)x = x^2 + x \equiv 1 \mod (x^2 + x + 1)$ .
- Alternatively, you may think of *extending* the field  $\mathbb{F}_2$  with an additional element  $\alpha$  satisfying  $\alpha^2 = \alpha + 1$ .
  - In much of the same way, the complex field is the extension of the real field with the addition of *i* that solves  $i^2 = -1$ .

イロン イボン イヨン イヨン 三日

- Answer: we see a vector in 𝔽<sup>m</sup><sub>q</sub> as coefficients of a polynomial of degree *m* − 1, and do multiplication of vectors as polynomial multiplications modulo a degree *n* irreducible polynomial.
- Example: On  $\mathbb{F}_2$ , the polynomial  $x^2 + x + 1$  is irreducible.
- $(1,1) \cdot (1,0) = (0,1)$  because  $(x+1)x = x^2 + x \equiv 1 \mod (x^2 + x + 1)$ .
- Alternatively, you may think of *extending* the field  $\mathbb{F}_2$  with an additional element  $\alpha$  satisfying  $\alpha^2 = \alpha + 1$ .
  - In much of the same way, the complex field is the extension of the real field with the addition of *i* that solves  $i^2 = -1$ .
  - So  $(\alpha + 1)\alpha = \alpha^2 + \alpha = 1$ .

イロン イボン イヨン イヨン 三日

- Answer: we see a vector in  $\mathbb{F}_q^m$  as coefficients of a polynomial of degree m-1, and do multiplication of vectors as polynomial multiplications modulo a degree *n* irreducible polynomial.
- Example: On  $\mathbb{F}_2$ , the polynomial  $x^2 + x + 1$  is irreducible.
- $(1,1) \cdot (1,0) = (0,1)$  because  $(x+1)x = x^2 + x \equiv 1 \mod (x^2 + x + 1)$ .
- Alternatively, you may think of *extending* the field  $\mathbb{F}_2$  with an additional element  $\alpha$  satisfying  $\alpha^2 = \alpha + 1$ .
  - In much of the same way, the complex field is the extension of the real field with the addition of *i* that solves  $i^2 = -1$ .

• So 
$$(\alpha + 1)\alpha = \alpha^2 + \alpha = 1$$
.

• One can show that degree *n* irreducible polynomials always exist for  $\mathbb{F}_{q}$ . So we can construct fields  $\mathbb{F}_{p^{m}}$  for any positive integer *m*.
